AQA GCSE Biology | 8461

SPECIFICATION POINT 4.4.1.1

Photosynthetic reaction

Mark schemes and examiner comments

Tier	**Foundation**
Question groups	**36**
Available paper years	**2008–2025**

Using this booklet

1. Booklet answer numbers match the question booklet.
2. Use the original question number within marking tables.
3. Examiner comments are included where available.

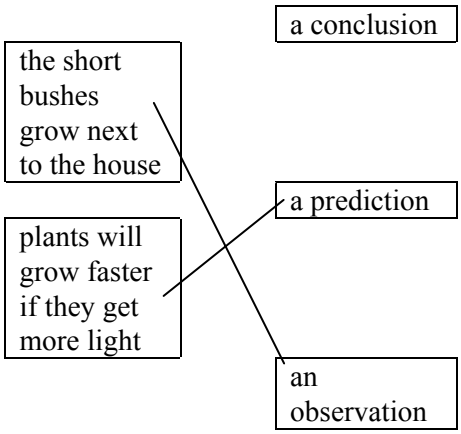

Name: _____ **Date:** _____

Where a precise marking extract is unavailable, the full source document is included in an appendix. Any missing mark scheme is explicitly identified.

4.4.1.1 Photosynthetic reaction

Answer 01 · Mark scheme January 2008 | BLY2F | Original Q4 | Legacy

Question 4

	answers	extra information	mark
(a)(i)		both correct = **2** marks one correct = **1** mark extra line from a statement cancels the mark	2
(a)(ii)	1st space: carbon dioxide 2nd space: glucose / sugar / starch / carbohydrate	allow CO_2 (ignore superscript) do **not** allow CO alone	1 1
(b)(i)	any **one** from: • move lamp or change distance between lamp and plant • change wattage / power of (light) bulb • change voltage / power supply to the (light) bulb • change the number of lamps • put translucent material between lamp and plant	 ignore measure the distance do **not** accept just "change bulb" accept examples, eg tracing paper / filters do **not** accept <u>coloured</u> filters	1

continued …

4.4.1.1 Photosynthetic reaction

BLY2F

Question 4 continued …

	answers	extra information	mark
(b)(ii)	rises levels off	ignore numbers	1 1
(b)(iii)	idea that it levels off **or** does not increase at all light intensities **or** it only increases to a certain amount	answers should relate to photosynthesis and **not** to bubbling	1
total			8

BLY2F

4.4.1.1 Photosynthetic reaction

Answer 12 · Mark scheme

Question 7

question	answers	extra information	mark
7(a)(i)	colour of light / bulb / lamp	allow wavelength for colour allow bulb alone do **not** accept light / colour unqualified	1
7(a)(ii)	any **one** from eg • temperature • light intensity **or** distance between lamp and plant / tube • carbon dioxide • other light in room • mass / size / amount / age / type of pondweed • volume / amount of water	 allow heat allow amount / brightness of light ignore light unqualified allow symbols allow use a dark room allow same piece of pondweed ignore pondweed unqualified ignore reference to time	1
7(a)(iii)	improved reliability **or** can spot anomalies / changes	allow for reliability **or** less likely to lose count allow reference to calculating a mean / average ignore reference to accuracy / precision / fair	1
7(b)(i)	green		1

Question 7 continues on the next page

4.4.1.1 Photosynthetic reaction

BLY2F

Question 7 continued

question	answers	extra information	mark
7(b)(ii)	any **two** from: • least / less bubbles / gas / oxygen / mean • least / less photosynthesis • least / less glucose / sugar / carbohydrate / food made	ignore references to colour reference to least / less needed only once, in context, for **2** marks only penalise no once, ie no bubbles = **0** mark no bubbles so no photosynthesis = **1** mark allow most / more green light reflected (by chloroplasts)	2
Total			**6**

Question 7 continued . . .

<table>
<tr><th>question</th><th colspan="4">Answers</th><th>extra information</th><th>mark</th></tr>
<tr><td rowspan="4">7(c)</td><td colspan="4">Marks awarded for this answer will be determined by the Quality of Written Communication (QWC) as well as the standard of the scientific response. Examiners should also refer to the information on page 5, and apply a ‘best-fit’ approach to the marking.</td><td></td><td>6</td></tr>
<tr><td>0 marks</td><td colspan="2">Level 1 (1-2 marks)</td><td>Level 2 (3-4 marks)</td><td>Level 3 (5-6 marks)</td><td></td></tr>
<tr><td>No relevant content.</td><td colspan="2">There is a brief description of at least 1 tissue or at least 1 function of an indicated part of the leaf.
The account lacks clarity or detail.</td><td>There is a clear description which includes at least 1 named tissue and at least 1 correct function described for an indicated part of the leaf.</td><td>There is a detailed description of most of the structures and their functions.</td><td></td></tr>
<tr><td colspan="5">examples of responses:
• epidermis
• cover the plant
• mesophyll / palisade
• photosynthesises
• phloem
• xylem
• transport.
The following points are all acceptable but beyond the scope of the specification:
• (waxy) cuticle – reduce water loss
• epidermis – no chloroplasts so allows light to penetrate
• stomata / guard cells – allow CO_2 in (and O_2 out) or controls water loss
• palisade (mesophyll) – <u>many</u> chloroplasts to trap light
– near top of leaf for receiving more light
• spongy (mesophyll) – air spaces for rapid movement of gases</td><td></td></tr>
<tr><td>Total</td><td colspan="3"></td><td></td><td>9</td></tr>

June 2016 | BL1FP | Original Q3 | Legacy

4.4.1.1 Photosynthetic reaction

Answer 23 · Mark scheme June 2016 | BL2FP | Original Q8 | Legacy

Question	Answers	Extra information	Mark	AO / Spec. Ref.
8			6	AO1/2/3 2.3.1a/b/c/d +prac

Marks awarded for this answer will be determined by the Quality of Written Communication (QWC) as well as the standard of the scientific response. Examiners should also refer to the information on page 5 and apply a 'best-fit' approach to the marking.

0 marks	Level 1 (1–2 marks)	Level 2 (3–4 marks)	Level 3 (5–6 marks)
No relevant content.	A partial description of how the apparatus is set up **or** a description of how light is supplied **or** a simple description of how photosynthesis can be measured. **or** a control variable	A description of how the apparatus is set up **and** a description of how photosynthesis can be measured. **or** a description of how light intensity is varied **or** a control variable **or** any other relevant point	A description of how the apparatus is used to measure the **rate** of photosynthesis at different light **intensities** is given. For full marks reference must be made to a control variable **or** repeats

examples of the points made in the response

- apparatus set up:
  - weed in water in beaker
  - light shining on beaker
- method of varying the light intensity – eg changing distance of lamp from plant
- method of controlling other variables
  - use same pond weed **or** same length of pond weed
  - temperature: water bath or heat screen
  - CO_2
- leave sufficient time at each new light intensity before measurements taken
- method of measuring photosynthesis – eg counting bubbles of gas released or collecting gas and measuring volume in a syringe
- measuring **rate of photosynthesis** by counting bubbles for set period of time
- repetitions

Version: 1.0 Final Mark Scheme

jun2084611F/MS

4.4.1.1 Photosynthetic reaction

MARK SCHEME – GCSE BIOLOGY – 8461/1F – JUNE 2020

Mark schemes are prepared by the Lead Assessment Writer and considered, together with the relevant questions, by a panel of subject teachers. This mark scheme includes any amendments made at the standardisation events which all associates participate in and is the scheme which was used by them in this examination. The standardisation process ensures that the mark scheme covers the students' responses to questions and that every associate understands and applies it in the same correct way. As preparation for standardisation each associate analyses a number of students' scripts. Alternative answers not already covered by the mark scheme are discussed and legislated for. If, after the standardisation process, associates encounter unusual answers which have not been raised they are required to refer these to the Lead Examiner.

It must be stressed that a mark scheme is a working document, in many cases further developed and expanded on the basis of students' reactions to a particular paper. Assumptions about future mark schemes on the basis of one year's document should be avoided; whilst the guiding principles of assessment remain constant, details will change, depending on the content of a particular examination paper.

Further copies of this mark scheme are available from aqa.org.uk

4.4.1.1 Photosynthetic reaction

Information to Examiners

1. General

The mark scheme for each question shows:

- the marks available for each part of the question
- the total marks available for the question
- the typical answer or answers which are expected
- extra information to help the Examiner make his or her judgement
- the Assessment Objectives, level of demand and specification content that each question is intended to cover.

The extra information is aligned to the appropriate answer in the left-hand part of the mark scheme and should only be applied to that item in the mark scheme.

At the beginning of a part of a question a reminder may be given, for example: where consequential marking needs to be considered in a calculation; or the answer may be on the diagram or at a different place on the script.

In general the right-hand side of the mark scheme is there to provide those extra details which confuse the main part of the mark scheme yet may be helpful in ensuring that marking is straightforward and consistent.

2. Emboldening and underlining

2.1 In a list of acceptable answers where more than one mark is available 'any **two** from' is used, with the number of marks emboldened. Each of the following bullet points is a potential mark.

2.2 A bold **and** is used to indicate that both parts of the answer are required to award the mark.

2.3 Alternative answers acceptable for a mark are indicated by the use of **or**. Different terms in the mark scheme are shown by a / ; eg allow smooth / free movement.

2.4 Any wording that is underlined is essential for the marking point to be awarded.

3. Marking points

3.1 Marking of lists

This applies to questions requiring a set number of responses, but for which students have provided extra responses. The general principle to be followed in such a situation is that 'right + wrong = wrong'.

Each error/contradiction negates each correct response. So, if the number of error/contradictions equals or exceeds the number of marks available for the question, no marks can be awarded.

However, responses considered to be neutral (indicated as * in example 1) are not penalised.

Example 1: What is the pH of an acidic solution?

[1 mark]

Student	Response	Marks awarded
1	green, 5	0
2	red*, 5	1
3	red*, 8	0

Example 2: Name two planets in the solar system.

[2 marks]

Student	Response	Marks awarded
1	Neptune, Mars, Moon	1
2	Neptune, Sun, Mars, Moon	0

3.2 Use of chemical symbols/formulae

If a student writes a chemical symbol/formula instead of a required chemical name, full credit can be given if the symbol/formula is correct and if, in the context of the question, such action is appropriate.

3.3 Marking procedure for calculations

Marks should be awarded for each stage of the calculation completed correctly, as students are instructed to show their working. Full marks can, however, be given for a correct numerical answer, without any working shown.

3.4 Interpretation of 'it'

Answers using the word 'it' should be given credit only if it is clear that the 'it' refers to the correct subject.

3.5 Errors carried forward

Any error in the answers to a structured question should be penalised once only.

Papers should be constructed in such a way that the number of times errors can be carried forward is kept to a minimum. Allowances for errors carried forward are most likely to be restricted to calculation questions and should be shown by the abbreviation ecf in the marking scheme.

3.6 Phonetic spelling

The phonetic spelling of correct scientific terminology should be credited **unless** there is a possible confusion with another technical term.

3.7 Brackets

(…..) are used to indicate information which is not essential for the mark to be awarded but is included to help the examiner identify the sense of the answer required.

3.8 Allow

In the mark scheme additional information, 'allow' is used to indicate creditworthy alternative answers.

3.9 Ignore

Ignore is used when the information given is irrelevant to the question or not enough to gain the marking point. Any further correct amplification could gain the marking point.

3.10 Do <u>not</u> accept

Do **not** accept means that this is a wrong answer which, even if the correct answer is given as well, will still mean that the mark is not awarded.

4. Level of response marking instructions

Extended response questions are marked on level of response mark schemes.

- Level of response mark schemes are broken down into levels, each of which has a descriptor.
- The descriptor for the level shows the average performance for the level.
- There are two marks in each level.

Before you apply the mark scheme to a student's answer, read through the answer and annotate it (as instructed) to show the qualities that are being looked for. You can then apply the mark scheme.

Step 1: Determine a level

Start at the lowest level of the mark scheme and use it as a ladder to see whether the answer meets the descriptor for that level. The descriptor for the level indicates the different qualities that might be seen in the student's answer for that level. If it meets the lowest level then go to the next one and decide if it meets this level, and so on, until you have a match between the level descriptor and the answer.

When assigning a level you should look at the overall quality of the answer. Do **not** look to penalise small and specific parts of the answer where the student has not performed quite as well as the rest. If the answer covers different aspects of different levels of the mark scheme you should use a best fit approach for defining the level.

Use the variability of the response to help decide the mark within the level, ie if the response is predominantly level 2 with a small amount of level 3 material it would be placed in level 2 but be awarded a mark near the top of the level because of the level 3 content.

Step 2: Determine a mark

Once you have assigned a level you need to decide on the mark. The descriptors on how to allocate marks can help with this.

The exemplar materials used during standardisation will help. There will be an answer in the standardising materials which will correspond with each level of the mark scheme. This answer will have been awarded a mark by the Lead Examiner. You can compare the student's answer with the example to determine if it is the same standard, better or worse than the example. You can then use this to allocate a mark for the answer based on the Lead Examiner's mark on the example.

You may well need to read back through the answer as you apply the mark scheme to clarify points and assure yourself that the level and the mark are appropriate.

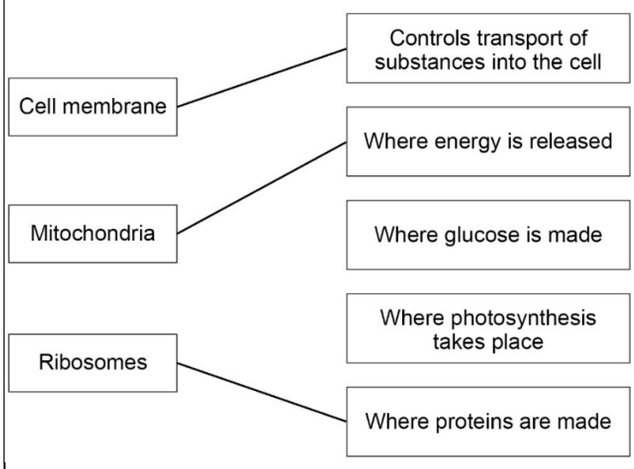

Indicative content in the mark scheme is provided as a guide for examiners. It is not intended to be exhaustive and you must credit other valid points. Students do **not** have to cover all of the points mentioned in the indicative content to reach the highest level of the mark scheme.

You should ignore any irrelevant points made. However, full marks can be awarded only if there are no incorrect statements that contradict a correct response.

An answer which contains nothing of relevance to the question must be awarded no marks.

4.4.1.1 Photosynthetic reaction

Answer 29 · Examiner comments November 2020 | 8461/1F | Original Q1

Question 1 (low demand)

A common misconception seen in **01.4** was that the mitochondria are the site of glucose production. In **01.7**, several students didn't appear to read the question carefully enough, with some subtracting 15 from 60, and some multiplying the values. Students are advised to check their answers carefully, as 60 ÷ 15 = 3 was seen on multiple occasions. In questions where students are asked to calculate magnification, care must be taken not to give (incorrect) units.

Answer 30 · Examiner comments November 2020 | 8461/1F | Original Q7

Question 7 (standard demand)

The equation for photosynthesis had been generally well learnt, with two-thirds of students scoring at least one mark. **07.2** was not answered well, with the reference to 'energy' leading some students to write confused accounts about respiration. Nearly two-thirds of students were able to identify the anomalous result in **07.4**. In **07.5**, reference to 'human error' on its own was insufficient.

The concept of denaturation in **07.8** was not acknowledged by most students, as they were unable to make the link between photosynthesis and enzymes. Students are advised to read and follow all of the instructions given when asked to draw a graph, as in **07.9**, many students missed key tasks despite them being listed clearly. Students need to understand how to draw a line/curve of best fit when the plots do not fall on a straight line and students generally could be more accurate when plotting points, particularly those that are not whole numbers. A few students plotted the three individual repeats for each temperature rather than the mean, which meant that no plotting marks could be awarded.

4.4.1.1 Photosynthetic reaction

Answer 33 · Examiner comments

June 2022 | 8461/1F | Original Q3

Question 3 (Low and standard demand)

03.1 When faced with the concept of understanding photosynthesis in a context other than that of the Required Practical Activity, some students faltered. Most students were able to name one control variable in the investigation, with the most common response being light (intensity). Many students gave 'type of tomato plant', despite the stem of the question indicating that the investigation was only carried out on one type of plant. A number of students confused the independent variable and the control variable, stating the percentage of carbon dioxide would be a control variable.

03.2 Over 80% of students were able to identify where the greatest change in rate occurred.

03.3 Over 85% of students understood that repeating readings would improve the validity of the results.

03.4 Very few students appeared to understand that the command word 'explain' required them to do just that. A number of students gave the values for the rate of photosynthesis at 0.00% and 0.08% carbon dioxide, but did not get credit for their answer as they did not go on to describe the increase. Very few students made the link between the increased rate and carbon dioxide being needed for the reaction, with less than 10% of students achieving both marks. It is worth noting here that a significant proportion of students continue to give the formula molecules such as carbon dioxide; if they do, the formula must be correct. CO2, CO^2 and Co2 are all incorrect.

03.5 Many students were able to articulate the idea that the rate of photosynthesis would not increase beyond 0.08% carbon dioxide, but making further links as to why this would influence the famer's decision were rarely seen, with less than 10% of students achieving both mark points. Occasionally, reference to global warming was seen, but often this was not linked to the increased concentration of carbon dioxide. This question was another example of where poor articulation and lack of explanatory detail cost some students marks; for example, phrases such as 'he would get the same result' was not enough to gain the mark.

4.4.1.1 Photosynthetic reaction

Answer 34 · Examiner comments — June 2022 | 8461/1F | Original Q5

Question 5 (Low and standard demand)

05.1 Over 90% of students were able to recall the equation for photosynthesis, however, there were still some unusual spellings of oxygen seen, despite the word being provided.

05.2 The structure of plant parts is still a difficult concept for many students, particularly at Foundation tier. Less than 20% of students gained full marks in this question, with over 35% gaining no marks at all.

05.3 For those students who performed the correct calculation in this question, many were not credited with MP3 as they mistakenly thought that 1.22 (2 decimal places) was the same as 2 significant figures. Other common errors included reversing the numerator and denominator in the calculation and simply subtracting the two values from the table, rather than dividing them.

05.4 Nearly 60% of students answered correctly.

Answer 34 · Examiner comments — June 2022 | 8461/1F | Original Q5

05.6 Only 45% of students were able to identify that increased temperature would increase the rate of transpiration. The most common incorrect answer was increased humidity, a concept that many students continue to find difficult.

05.7 Nearly 85% of students correctly identified plant **C** as most likely to live in a desert.

05.8 Over 60% of students were able to describe that the spines on the gorse plant would stop the plant from being eaten, but there were many vague and uncreditworthy answers seen also, such as ‘they defend / protect the plant’ or ‘they warn things off’. Answers relating to water loss were rarely, if ever, seen.

05.9 When faced with the context of mimicry in this question, many students struggled, often coming up with ideas about the similarity of the colours of both insects, that the hornet moth possessed poisons / venom / toxins, carried bacteria or diseases or that they possessed an internal 'stinger' which would harm predators. None of these ideas could be ascertained from the figure provided and therefore were not creditworthy. Over 50% of students scored zero marks on this question.

4.4.1.1 Photosynthetic reaction

Answer 35 · Examiner comments

June 2023 | 8461/1F | Original Q3

Question 3 (Low and standard demand)

03.1 It was pleasing to see that over two thirds of students could demonstrate sound recall of the equation for photosynthesis and gained all three marks. Glucose was sometimes incorrectly given as a reactant, and protein or fat occasionally, as a product.

03.2 This question proved a challenge for many students, and many attempted to explain how the oxygen might enter or be carried by red blood cells, rather than how it is used by cells. Answers such as this gained no credit, and almost 60% of student gained zero marks. While some correctly mentioned 'respiration', only 10% of students went on to discuss the resultant release of energy for the second mark. Incorrect responses which suggested that energy could be 'made' were less obvious than in previous years. Several answers referred to respiration occurring in mitochondria and this was given credit for two marks.

03.3 It was very pleasing to note that students are acutely aware of health and safety issues in practical work. The hazards and risks in this question were in the context of an investigation into light and photosynthesis. Credit could not, therefore, be given to the idea of harmful liquids splashing into eyes as only water was used. Neither were marks awarded for the idea that the light in the experiment could damage eyesight. Almost 36% of responses seen gained both marking points, with reference to possible burns from hot bulbs being the most common. Those who mentioned broken glassware often failed to gain two marks by failing to go on to suggest that this might lead to cuts of the skin. Other weak responses just mentioned possible electrocution without giving a clear linked hazard.

03.4 This question proved a good discriminator, with only around 22% of students gaining the mark. Many vague responses were seen, for example, keeping the apparatus in the same room each time the experiment was carried out, and others believed that the beaker of water should be heated with a Bunsen burner. Some students said that they would keep a check on the temperature by using a thermometer but failed to give any idea of what should be done if this temperature changed. Good answers referred to use of a water bath or an LED bulb. Credit was given to the idea of insulating the beaker provided that the material used, if mentioned, would still allow light through.

03.5 Students found it hard to express their ideas when answering this question, and consequently just over half of students failed to gain either available marking point. Responses that did not gain credit included – 'to make the experiment fair', 'to make sure everything was accurate', 'to keep the results the same all the time', 'because the pondweed could die if it got too hot'. One mark was given for acknowledging that temperature affects photosynthesis in some way, and where students gained only 1 mark, it was usually for this idea. The second part of the explanation, however, that this would then affect the actual results obtained was less frequently seen.

03.6 Almost all students that attempted this question, correctly chose the colour blue.

03.7 A little over two thirds of students were successful in identifying a bar graph, as being the best way to display the results.

03.8 The majority of students failed to name a piece of apparatus used to measure the volume of oxygen produced. Around 30% of students gained the mark, and indeed the use of a measuring cylinder was the most common response.

03.9 Over two thirds of students gained the first mark here by correctly stating that as light intensity increased, the rate of photosynthesis did the same. A few failed to gain credit as they gave

4.4.1.1 Photosynthetic reaction

Answer 35 · Examiner comments June 2023 | 8461/1F | Original Q3

the relationship the wrong way round, thereby implying that an increase in photosynthesis caused the increase in light. Only 10% of students gained the second mark for the increase of both being at the same rate as each other. A few incorrectly suggested that the rate was 'constant'.

Answer 36 · Examiner comments June 2025 | 8461/1F | Original Q2

Question 2 (low demand)

02.1 Two thirds of students were able to correctly identify the independent variable.

02.2 77% of students scored full marks in this question. The most frequently seen errors were nitrogen for MP1 and cellulose for MP2.

02.3 A third of students scored 2 marks, a third 1 mark and a third zero marks in this question. Many students did not realise that the data recorded was the time taken to release 10 bubbles, rather than the number of bubbles released in a set time. A significant proportion of students, therefore, struggled to articulate their ideas, with a lot of confusion over time and speed seen. Answers given, therefore, incorrectly described an increase followed by a decrease. Many gained MP1 but fewer went on to match MP2. They referred, instead, to the overall decrease up to 60 °C rather than giving consideration to the 'describe' command word which encompassed the whole span of the investigation. Credit was given for correct references to rate, rather than directly to time itself, but answers such as 'it gets quicker or slower' were too vague. Mention of an optimum temperature without any other information about time taken

4.4.1.1 Photosynthetic reaction

Answer 36 · Examiner comments

before or after this value was insufficient. Explanations were not asked for in this question.

02.4 Nearly 60% of students scored full marks in this question, but of the 20% awarded zero marks, the most common incorrect response seen was to use 50 as the numerator, despite the equation being given in the question. Common errors included:

- giving a final answer of 0.30 or 0.3 with a dot to indicate a recurring number, in which case a maximum of 2 marks was considered.
- use of a time from a temperature other than 50 °C, in which case a maximum of 1 mark was given if the correctly calculated value was rounded to 1dp.
- incorrect calculation of a correct substitution (10÷33) giving an answer of 3.3, in which case a maximum of 1 mark was given for MP1.
- use of the figure for temperature, 50 °C, instead of 33 in the equation, in which case no marks were awarded.

02.5 74% of students achieved the mark in this question.

02.6 Three quarters of students achieved the mark in this question.

02.7 Nearly 70% of students scored full marks in this question, with a further 26% scoring one mark.
