AQA GCSE Combined Science - Trilogy | 8464

SPECIFICATION POINT 4.2.2.3

Blood

Mark schemes and examiner comments

Tier	**Foundation**
Question groups	**4**
Available paper years	**2018–2025**

Using this booklet

1. Booklet answer numbers match the question booklet.
2. Use the original question number within marking tables.
3. Examiner comments are included where available.

Name: _____ **Date:** _____

Where a precise marking extract is unavailable, the full source document is included in an appendix. Any missing mark scheme is explicitly identified.

4.2.2.3 Blood

Answer 01 · Mark scheme

June 2018 | 8464/B/1F | Original Q1

The full source mark scheme begins on page 11. Follow original question 1 in that document.

4.2.2.3 Blood

Answer 02 · Mark scheme

COMBINED SCIENCE: TRILOGY

8464/B/1F – BIOLOGY PAPER 1 FOUNDATION TIER

Mark scheme

8464

June 2018

Version/Stage: 1.0 Final

4.2.2.3 Blood

Mark schemes are prepared by the Lead Assessment Writer and considered, together with the relevant questions, by a panel of subject teachers. This mark scheme includes any amendments made at the standardisation events which all associates participate in and is the scheme which was used by them in this examination. The standardisation process ensures that the mark scheme covers the students' responses to questions and that every associate understands and applies it in the same correct way. As preparation for standardisation each associate analyses a number of students' scripts. Alternative answers not already covered by the mark scheme are discussed and legislated for. If, after the standardisation process, associates encounter unusual answers which have not been raised they are required to refer these to the Lead Assessment Writer.

It must be stressed that a mark scheme is a working document, in many cases further developed and expanded on the basis of students' reactions to a particular paper. Assumptions about future mark schemes on the basis of one year's document should be avoided; whilst the guiding principles of assessment remain constant, details will change, depending on the content of a particular examination paper.

Further copies of this mark scheme are available from aqa.org.uk

MARK SCHEME – GCSE COMBINED SCIENCE: TRILOGY – 8464/B/1F – JUNE 2018

Information to Examiners

1. General

The mark scheme for each question shows:

- the marks available for each part of the question
- the total marks available for the question
- the typical answer or answers which are expected
- extra information to help the Examiner make his or her judgement
- the Assessment Objectives and specification content that each question is intended to cover.

The extra information is aligned to the appropriate answer in the left-hand part of the mark scheme and should only be applied to that item in the mark scheme.

At the beginning of a part of a question a reminder may be given, for example: where consequential marking needs to be considered in a calculation; or the answer may be on the diagram or at a different place on the script.

In general the right-hand side of the mark scheme is there to provide those extra details which confuse the main part of the mark scheme yet may be helpful in ensuring that marking is straightforward and consistent.

2. Emboldening and underlining

2.1 In a list of acceptable answers where more than one mark is available 'any **two** from' is used, with the number of marks emboldened. Each of the following bullet points is a potential mark.

2.2 A bold **and** is used to indicate that both parts of the answer are required to award the mark.

2.3 Alternative answers acceptable for a mark are indicated by the use of **or**. Different terms in the mark scheme are shown by a / ; eg allow smooth / free movement.

2.4 Any wording that is underlined is essential for the marking point to be awarded.

3. Marking points

3.1 Marking of lists

This applies to questions requiring a set number of responses, but for which students have provided extra responses. The general principle to be followed in such a situation is that 'right + wrong = wrong'.

Each error / contradiction negates each correct response. So, if the number of error / contradictions equals or exceeds the number of marks available for the question, no marks can be awarded.

However, responses considered to be neutral (indicated as * in example 1) are not penalised.

Example 1: What is the pH of an acidic solution?

[1 mark]

Student	Response	Marks awarded
1	green, 5	0
2	red*, 5	1
3	red*, 8	0

Example 2: Name two planets in the solar system.

[2 marks]

Student	Response	Marks awarded
1	Neptune, Mars, Moon	1
2	Neptune, Sun, Mars, Moon	0

3.2 Use of chemical symbols / formulae

If a student writes a chemical symbol / formula instead of a required chemical name, full credit can be given if the symbol / formula is correct and if, in the context of the question, such action is appropriate.

3.3 Marking procedure for calculations

Marks should be awarded for each stage of the calculation completed correctly, as students are instructed to show their working. Full marks can, however, be given for a correct numerical answer, without any working shown.

3.4 Interpretation of 'it'

Answers using the word 'it' should be given credit only if it is clear that the 'it' refers to the correct subject.

3.5 Errors carried forward

Any error in the answers to a structured question should be penalised once only.

Papers should be constructed in such a way that the number of times errors can be carried forward is kept to a minimum. Allowances for errors carried forward are most likely to be restricted to calculation questions and should be shown by the abbreviation ecf in the marking scheme.

3.6 Phonetic spelling

The phonetic spelling of correct scientific terminology should be credited **unless** there is a possible confusion with another technical term.

3.7 Brackets

(…..) are used to indicate information which is not essential for the mark to be awarded but is included to help the examiner identify the sense of the answer required.

3.8 Allow

In the mark scheme additional information, 'allow' is used to indicate creditworthy alternative answers.

3.9 Ignore

Ignore is used when the information given is irrelevant to the question or not enough to gain the marking point. Any further correct amplification could gain the marking point.

3.10 Do <u>not</u> accept

Do **not** accept means that this is a wrong answer which, even if the correct answer is given as well, will still mean that the mark is not awarded.

4. Level of response marking instructions

Extended response questions are marked on level of response mark schemes.

- Level of response mark schemes are broken down into levels, each of which has a descriptor.
- The descriptor for the level shows the average performance for the level.
- There are two marks in each level.

Before you apply the mark scheme to a student's answer, read through the answer and annotate it (as instructed) to show the qualities that are being looked for. You can then apply the mark scheme.

MARK SCHEME – GCSE COMBINED SCIENCE: TRILOGY – 8464/B/1F – JUNE 2018

Step 1: Determine a level

Start at the lowest level of the mark scheme and use it as a ladder to see whether the answer meets the descriptor for that level. The descriptor for the level indicates the different qualities that might be seen in the student's answer for that level. If it meets the lowest level then go to the next one and decide if it meets this level, and so on, until you have a match between the level descriptor and the answer.

When assigning a level you should look at the overall quality of the answer. Do **not** look to penalise small and specific parts of the answer where the student has not performed quite as well as the rest. If the answer covers different aspects of different levels of the mark scheme you should use a best fit approach for defining the level.

Use the variability of the response to help decide the mark within the level, ie if the response is predominantly level 2 with a small amount of level 3 material it would be placed in level 2 but be awarded a mark near the top of the level because of the level 3 content.

Step 2: Determine a mark

Once you have assigned a level you need to decide on the mark. The descriptors on how to allocate marks can help with this.

The exemplar materials used during standardisation will help. There will be an answer in the standardising materials which will correspond with each level of the mark scheme. This answer will have been awarded a mark by the Lead Examiner. You can compare the student's answer with the example to determine if it is the same standard, better or worse than the example. You can then use this to allocate a mark for the answer based on the Lead Examiner's mark on the example.

You may well need to read back through the answer as you apply the mark scheme to clarify points and assure yourself that the level and the mark are appropriate.

Indicative content in the mark scheme is provided as a guide for examiners. It is not intended to be exhaustive and you must credit other valid points. Students do **not** have to cover all of the points mentioned in the indicative content to reach the highest level of the mark scheme.

You should ignore any irrelevant points made. However, full marks can be awarded only if there are no incorrect statements that contradict a correct response.

An answer which contains nothing of relevance to the question must be awarded no marks.

4.2.2.3 Blood

MARK SCHEME – GCSE COMBINED SCIENCE: TRILOGY – 8464/B/1F – JUNE 2018

Question	Answers	Extra information	Mark	AO / Spec. Ref.
01.1	cell membrane	extra ticks negates marks	1	AO1 4.1.1.2

4.2.2.3 Blood

Answer 02 · Examiner comments

June 2023 | 8464/B/1F | Original Q4

Question 4

04.1 Just under a third of students identified blood vessel A as the vena cava. Despite the question saying that the vena cava carries blood into the heart, vessels B and C, the pulmonary artery and the aorta, were selected almost as often as the correct answer.

04.2 Less than a third of students knew that the left ventricle is the chamber that pumps blood to the body.

04.3 Less than a third of students knew that the blood vessel that carries blood to the heart muscle is called the coronary artery. Most students thought it was the pulmonary artery.

04.4 Responses for identifying the blood vessel that has valves were evenly split between artery, capillary and vein.

04.5 Only a quarter of students knew the function of valves. The idea of preventing backflow of blood, or keeping blood flowing in the correct direction was required. Common incorrect responses included to pump blood, to control the flow of blood, to open and close or to prevent leaks.

04.6 Fewer than a fifth of students scored any marks. Of these most scored 1 mark, usually for saying capillaries have thin walls. Simply saying capillaries are thin was insufficient. There were many misconceptions about the structure of a capillary; some saying they had valves, a thick wall or a large lumen. Very few students understood the function of capillaries.

04.7 Over four fifths of students recognised how 5 000 000 is written in standard form.

04.8 Only a tenth of students scored both marks. Two fifths of students scored at least 1 mark which was usually for identifying Person X, who had the lowest concentration of platelets, as the person whose blood would not clot properly. Quite a lot of students thought Person X would also be most likely to have an infection.

04.9 Almost four fifths of students scored the first marking point for saying that more oxygen can be transported if there are more red blood cells. Knowing that oxygen is transported by red blood cells gained credit. Only a few students said oxygen is needed for respiration. Only a tenth of students scored 2 or more marks. This was usually for marking points 1 and 3, for example more oxygen can be carried so the athlete has more energy. If they said energy was made, produced or created the third marking point could not be awarded.

Answer 03 · Examiner comments

June 2024 | 8464/B/1F | Original Q3

Question 3 (low & standard demand)

03.1 28% of students could correctly identify a white blood cell.

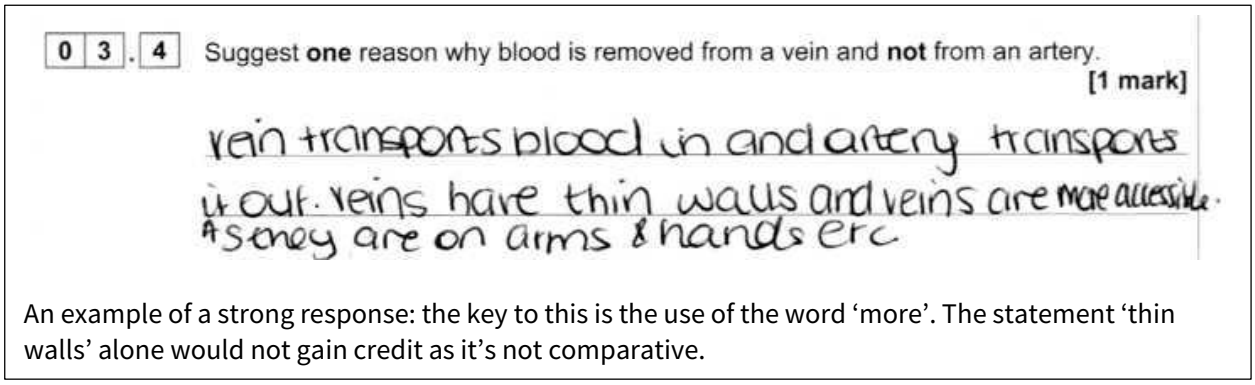

03.2 Most students (61%) could correctly pick platelets.

03.3 This question was well answered, with 58% of students gaining 2 marks. The most common correct answers were oxygen, glucose, carbon dioxide and water. The main misconceptions were where students named components of the blood such as red blood cells, white blood cells and platelets.

03.4 Answers for this question needed to be comparative and so 'easy to extract' was not good enough to gain credit. In the best answers students clearly articulated why blood is taken from a vein. Most students who successfully achieved this stated that veins were 'easier to access' or 'closer to the surface'. Other common correct answers were (in veins) 'blood pressure is lower', it's 'easier to extract the blood', and 'veins have thinner walls.

Many students who did not gain credit wrote about the direction of blood flow and oxygenated and deoxygenated blood.

There were some misconceptions with regards to veins having less blood than arteries.

An example of a strong response: the key to this is the use of the word 'more'. The statement 'thin walls' alone would not gain credit as it's not comparative.

03.5 For the advantages, most students were able to articulate that lives are saved, or that quality of life is improved. Several students simply stated that it 'increased blood levels' without any further qualification, which was insufficient.

For the disadvantages, many students correctly identified risk of infection, or a named blood-borne infection, or risk of rejection. Many were able to talk about the blood type might not match. Some responses did not provide enough details for an allergic reaction and often had written insufficient statements such as 'side effects.

03.6 For the advantages, most students were able to access marking points stating that they were helping others or they were saving a life. Many students had written that the donor could have full health checks as a result, but this was insufficient for this marking point.

For the disadvantages, many students could articulate pain, risk of infection or name symptoms of being unwell. A common misconception was that donors would lose blood or too much blood, rather than stating that the disadvantage was the risk of re-bleeding.

Answer 04 · Examiner comments

Question 1 (Low and Standard demand)

01.1 70% of students gained 2 marks. The majority of students correctly identified the nucleus, however, identification of the cytoplasm was seen less frequently.

01.2 This question required students to recall the function of the nucleus. It was generally well answered, with the majority of students, 60%, gaining at least one mark.

Answers that referred only to 'genetic information' were not creditworthy unless supported with accurate biological terms such as DNA, genes or chromosomes.

Some students disqualified otherwise correct answers by including incorrect functions.

01.3 This question was generally well attempted, with the majority of students correctly identifying the cell membrane as the part of the cell responsible for controlling what enters and leaves. The most common incorrect answer was cell wall.

01.4 71% of students gained the mark on this question.

01.5 93% of students gained at least one mark, with 57% gaining both marks.

01.6 Only 33% of students gained the mark on this question. The most frequently chosen incorrect answer was embryonic stem cells.

01.7 72% of students gained the mark on this question.

01.8 This question was designed to assess students' ability to interpret and apply data. Many students found this question challenging and only 42% gained 1 mark or more.
Responses that simply restated numerical values or general facts without interpretation were not awarded marks. Students were expected to provide comparative statements—for example, 'more red blood cells are produced from a smaller sample' or 'smaller donations mean fewer donors are needed'— which demonstrated an ability to interpret data and reason effectively.

Statements such as 'less risk of pathogens' were accepted, assuming students were referring to blood-borne infections.

Many students gave vague or generalised responses such as 'safer', 'less risk of disease', or 'fewer side effects'. These phrases were too imprecise and were not credited.

This question highlighted the need for students to develop their data interpretation and scientific reasoning skills, especially in the context of unfamiliar or applied scenarios.

4.2.2.3 Blood

Answer 04 · Examiner comments June 2025 | 8464/B/1F | Original Q1

Suggest **two** reasons that support the scientist's statement.

[2 marks]

In this example, both points made by the student demonstrate a clear comparison between the two types of blood products. As a result, the response was awarded 2 marks.

The student successfully contrasts relevant features, meeting the requirement for comparative statements rather than simply listing characteristics. This level of comparison was expected for credit and was not always achieved by students. These responses serve as good examples of how to meet the comparative marking criteria clearly and concisely.
