AQA GCSE Combined Science - Trilogy | 8464

SPECIFICATION POINT 4.3.1.3

Bacterial diseases

Mark schemes and examiner comments

Tier	**Foundation**
Question groups	**5**
Available paper years	**2018–2024**

Using this booklet

1. Booklet answer numbers match the question booklet.
2. Use the original question number within marking tables.
3. Examiner comments are included where available.

Name: _____ **Date:** _____

Where a precise marking extract is unavailable, the full source document is included in an appendix. Any missing mark scheme is explicitly identified.

4.3.1.3 Bacterial diseases

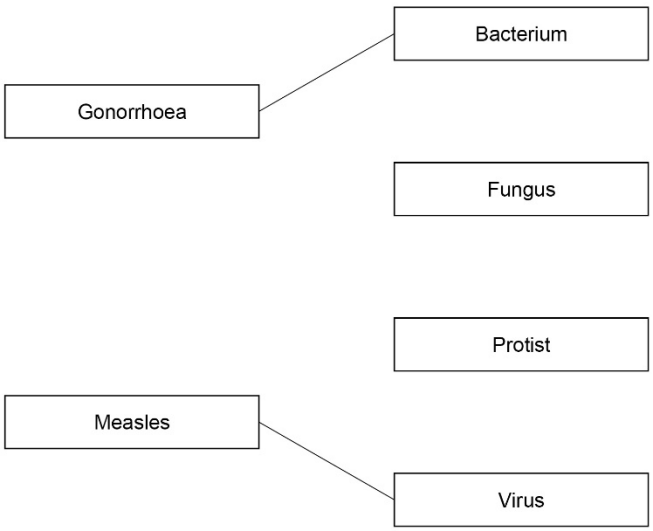

Answer 01 · Mark scheme

June 2018 | 8464/B/1F | Original Q1

The full source mark scheme begins on page 16. Follow original question 1 in that document.

4.3.1.3 Bacterial diseases

Answer 02 · Mark scheme November 2020 | 8464/B/1F | Original Q4

Question	Answers	Extra information	Mark	AO / Spec. Ref.
04.1	extra line(s) from a disease negates that mark  		1 1	AO1 4.3.1.2 4.3.1.3
04.2	any **two** from: • skin (acts as a barrier) • mucus in trachea / bronchi • mucus in nose • cilia (in trachea / bronchi / respiratory tract) • (hydrochloric) acid in stomach	ignore references to the immune response allow mucus in airways allow mucus unqualified if **neither** idea given ignore references to hairs allow scab forms (if you cut yourself) allow tears	2	AO1 4.3.1.6

4.3.1.3 Bacterial diseases

Answer 02 · Mark scheme

Question	Answers	Mark	AO / Spec. Ref.
04.3	**Level 2:** Scientifically relevant facts, events or processes are identified and given in detail to form an accurate account.	4-6	AO1 4.2.2.3 4.3.1.1 4.3.1.6
	Level 1: Facts, events or processes are identified and simply stated but their relevance is not clear.	1–3	
	No relevant content	0	
	Indicative content • white blood cells • detect / identify foreign antigens / cells / pathogens / bacteria • destroy / kill invading cells • phagocytes • engulf invading cells • digest / kill invading cells • produce antibodies • (antibodies) attach to invading cells • (antibodies) destroy / kill invading cells • (antibodies) make invading cells clump together • (so) phagocytes can engulf more cells / pathogens / bacteria • produce antitoxins • to destroy toxins • (so) less tissue damage • (therefore) don't feel as ill • produce memory cells • (so) immune response (to later exposure) is faster A description of the ways that white blood cells act is needed for Level 2.		

4.3.1.3 Bacterial diseases

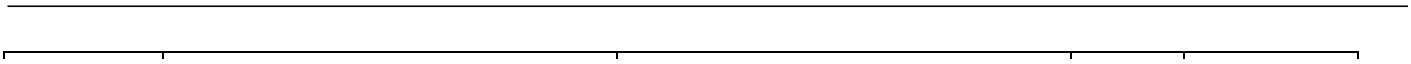

Answer 02 · Mark scheme

04.4	any **one** from: • HIV is a virus • antibiotics do **not** kill viruses • antibiotics (are used to) kill bacteria	allow HIV is **not** a bacterium	1	AO1 4.3.1.2 4.3.1.8
04.5	any **two** from: • avoid sexual intercourse • use a condom • do not share needles • use antiretroviral drugs • screen blood used for transfusions	ignore handwashing ignore social distancing allow practise safe sex ignore use protection unqualified ignore use contraception unqualified ignore use medication unqualified allow have regular checks / tests to see if you have HIV if no other marks awarded allow **1** mark for do not exchange body fluids	2	AO1 4.3.1.1 4.3.1.2
04.6	HIV damages the immune system		1	AO1 4.3.1.2
Total			**14**

8464/B/1F – BIOLOGY PAPER 1 FOUNDATION TIER

Mark scheme

8464

June 2018

Version/Stage: 1.0 Final

4.3.1.3 Bacterial diseases

Mark schemes are prepared by the Lead Assessment Writer and considered, together with the relevant questions, by a panel of subject teachers. This mark scheme includes any amendments made at the standardisation events which all associates participate in and is the scheme which was used by them in this examination. The standardisation process ensures that the mark scheme covers the students' responses to questions and that every associate understands and applies it in the same correct way. As preparation for standardisation each associate analyses a number of students' scripts. Alternative answers not already covered by the mark scheme are discussed and legislated for. If, after the standardisation process, associates encounter unusual answers which have not been raised they are required to refer these to the Lead Assessment Writer.

It must be stressed that a mark scheme is a working document, in many cases further developed and expanded on the basis of students' reactions to a particular paper. Assumptions about future mark schemes on the basis of one year's document should be avoided; whilst the guiding principles of assessment remain constant, details will change, depending on the content of a particular examination paper.

Further copies of this mark scheme are available from aqa.org.uk

MARK SCHEME – GCSE COMBINED SCIENCE: TRILOGY – 8464/B/1F – JUNE 2018

Information to Examiners

1. General

The mark scheme for each question shows:

- the marks available for each part of the question
- the total marks available for the question
- the typical answer or answers which are expected
- extra information to help the Examiner make his or her judgement
- the Assessment Objectives and specification content that each question is intended to cover.

The extra information is aligned to the appropriate answer in the left-hand part of the mark scheme and should only be applied to that item in the mark scheme.

At the beginning of a part of a question a reminder may be given, for example: where consequential marking needs to be considered in a calculation; or the answer may be on the diagram or at a different place on the script.

In general the right-hand side of the mark scheme is there to provide those extra details which confuse the main part of the mark scheme yet may be helpful in ensuring that marking is straightforward and consistent.

2. Emboldening and underlining

2.1 In a list of acceptable answers where more than one mark is available 'any **two** from' is used, with the number of marks emboldened. Each of the following bullet points is a potential mark.

2.2 A bold **and** is used to indicate that both parts of the answer are required to award the mark.

2.3 Alternative answers acceptable for a mark are indicated by the use of **or**. Different terms in the mark scheme are shown by a / ; eg allow smooth / free movement.

2.4 Any wording that is underlined is essential for the marking point to be awarded.

3. Marking points

3.1 Marking of lists

This applies to questions requiring a set number of responses, but for which students have provided extra responses. The general principle to be followed in such a situation is that 'right + wrong = wrong'.

Each error / contradiction negates each correct response. So, if the number of error / contradictions equals or exceeds the number of marks available for the question, no marks can be awarded.

However, responses considered to be neutral (indicated as * in example 1) are not penalised.

Example 1: What is the pH of an acidic solution?

[1 mark]

Student	Response	Marks awarded
1	green, 5	0
2	red*, 5	1
3	red*, 8	0

Example 2: Name two planets in the solar system.

[2 marks]

Student	Response	Marks awarded
1	Neptune, Mars, Moon	1
2	Neptune, Sun, Mars, Moon	0

3.2 Use of chemical symbols / formulae

If a student writes a chemical symbol / formula instead of a required chemical name, full credit can be given if the symbol / formula is correct and if, in the context of the question, such action is appropriate.

3.3 Marking procedure for calculations

Marks should be awarded for each stage of the calculation completed correctly, as students are instructed to show their working. Full marks can, however, be given for a correct numerical answer, without any working shown.

3.4 Interpretation of 'it'

Answers using the word 'it' should be given credit only if it is clear that the 'it' refers to the correct subject.

3.5 Errors carried forward

Any error in the answers to a structured question should be penalised once only.

Papers should be constructed in such a way that the number of times errors can be carried forward is kept to a minimum. Allowances for errors carried forward are most likely to be restricted to calculation questions and should be shown by the abbreviation ecf in the marking scheme.

3.6 Phonetic spelling

The phonetic spelling of correct scientific terminology should be credited **unless** there is a possible confusion with another technical term.

3.7 Brackets

(…..) are used to indicate information which is not essential for the mark to be awarded but is included to help the examiner identify the sense of the answer required.

3.8 Allow

In the mark scheme additional information, 'allow' is used to indicate creditworthy alternative answers.

3.9 Ignore

Ignore is used when the information given is irrelevant to the question or not enough to gain the marking point. Any further correct amplification could gain the marking point.

3.10 Do <u>not</u> accept

Do **not** accept means that this is a wrong answer which, even if the correct answer is given as well, will still mean that the mark is not awarded.

4. Level of response marking instructions

Extended response questions are marked on level of response mark schemes.

- Level of response mark schemes are broken down into levels, each of which has a descriptor.
- The descriptor for the level shows the average performance for the level.
- There are two marks in each level.

Before you apply the mark scheme to a student's answer, read through the answer and annotate it (as instructed) to show the qualities that are being looked for. You can then apply the mark scheme.

Step 1: Determine a level

Start at the lowest level of the mark scheme and use it as a ladder to see whether the answer meets the descriptor for that level. The descriptor for the level indicates the different qualities that might be seen in the student's answer for that level. If it meets the lowest level then go to the next one and decide if it meets this level, and so on, until you have a match between the level descriptor and the answer.

When assigning a level you should look at the overall quality of the answer. Do **not** look to penalise small and specific parts of the answer where the student has not performed quite as well as the rest. If the answer covers different aspects of different levels of the mark scheme you should use a best fit approach for defining the level.

Use the variability of the response to help decide the mark within the level, ie if the response is predominantly level 2 with a small amount of level 3 material it would be placed in level 2 but be awarded a mark near the top of the level because of the level 3 content.

Step 2: Determine a mark

Once you have assigned a level you need to decide on the mark. The descriptors on how to allocate marks can help with this.

The exemplar materials used during standardisation will help. There will be an answer in the standardising materials which will correspond with each level of the mark scheme. This answer will have been awarded a mark by the Lead Examiner. You can compare the student's answer with the example to determine if it is the same standard, better or worse than the example. You can then use this to allocate a mark for the answer based on the Lead Examiner's mark on the example.

You may well need to read back through the answer as you apply the mark scheme to clarify points and assure yourself that the level and the mark are appropriate.

Indicative content in the mark scheme is provided as a guide for examiners. It is not intended to be exhaustive and you must credit other valid points. Students do **not** have to cover all of the points mentioned in the indicative content to reach the highest level of the mark scheme.

You should ignore any irrelevant points made. However, full marks can be awarded only if there are no incorrect statements that contradict a correct response.

An answer which contains nothing of relevance to the question must be awarded no marks.

4.3.1.3 Bacterial diseases

MARK SCHEME – GCSE COMBINED SCIENCE: TRILOGY – 8464/B/1F – JUNE 2018

Question	Answers	Extra information	Mark	AO / Spec. Ref.
01.1	cell membrane	extra ticks negates marks	1	AO1 4.1.1.2

4.3.1.3 Bacterial diseases

Answer 03 · Examiner comments November 2021 | 8464/B/1F | Original Q2

Question 2 (low & standard demand)

This question was about communicable diseases. Most students performed well across the questions relating to the antibiotic investigation. The most common control variables given were the length of time the Petri dishes were incubated, the incubation temperature or the size of the paper discs. Some students gave more than two correct control variables, but if an additional incorrect variable was given the list principle was applied and maximum marks were not awarded. It is advisable just to give the number of variables specified in the question.

Most students correctly interpreted the results shown on the two Petri dishes and selected the correct conclusions. The two questions relating to fungal nail infections were set at a higher level of demand. Some students referred to cleaning hands, surfaces or tools between customers to reduce the risk of nail infections being spread. Wearing gloves or PPE was ignored unless qualified, for example by saying wear new gloves for each customer.

Answer 04 · Examiner comments June 2022 | 8464/B/1F | Original Q5

Question 5 (standard demand)

05.1 A quarter of students scored both marks for identifying the cell membrane and cytoplasm as structures that are found in both bacterial and animal cells. Just over three-quarters scored at least one mark. Two fifths of students incorrectly thought that both types of cell contained a nucleus.

05.2 One symptom of salmonella food poisoning was asked for, with students instructed not to refer to vomiting and diarrhoea. Almost half of the students were awarded the mark, usually for stomach ache or fever. Many described fever as having a high temperature or sweating, which were allowed. A few said ‘nausea’ which is equivalent to vomiting, and so was ignored. Many references to secondary symptoms of an infection were given, which could have applied to a wide range of infections. For example, tiredness, fatigue, headaches, dizziness, fainting or dehydration. These were all ignored. A primary symptom, such as those given in the specification, was needed.

05.3 36% of students said that penicillin was the first antibiotic developed. A wide range of phonetic spellings were accepted. The most common incorrect answers were the names of well-known painkillers. Quite a lot of students did not attempt the question.

05.4 A fifth of students scored this mark. Most correct responses referred to a time delay before the antibiotics became effective, or started working. A few students said the bacteria would be reproducing or multiplying. There was some confusion with antibodies, and incorrect references to bacteria fighting the antibiotics, or antibiotics fighting bacteria. Some thought that antibiotics make antibodies, whilst others said that the wrong antibiotic had been given.

05.5 Half of the students knew that a child will start to feel better after taking antibiotics for a few days because there will be fewer toxins in the body. Most other students thought the child had become resistant to the bacteria.

4.3.1.3 Bacterial diseases

Answer 04 · Examiner comments June 2022 | 8464/B/1F | Original Q5

05.6 15% of students scored the mark, usually for saying overuse of antibiotics could result in antibiotic resistance. Quite a lot of students said the patient or the antibiotic would become resistant, which was incorrect. A common mistake was to confuse immunity with resistance. Many students scored the mark for the idea that the person would get better without taking any antibiotics, which was allowed.

05.7 A third of students thought antibodies are produced by red blood cells, with slightly fewer selecting the correct drawing of the white blood cell. It could be that students were unfamiliar with drawings of blood components.

05.8 A third of students identified platelets as the part of the blood that starts the clotting process. Few selected plasma as their answer.

June 2024 | 8464/B/1F | Original Q4

Question 4 (low & standard demand)

04.1 The majority of students gave the correct symptom of gonorrhoea.

04.2 This question was well answered: 63% gained credit, with most correct answers being gained from 'not all cases are reported/recorded' (or words to that effect). The idea of false positives and negatives was seen by examiners less often; however, the idea of misdiagnosis was seen more frequently. References to population numbers only being estimates was very rarely seen.

Some students incorrectly commented on the numbers and data given in the table and a significant few suggested that the 100 000 was an estimate as the numbers were too high to count. Other students talked about not being able to ask everyone in the city.

Some students incorrectly said the numbers weren't accurate because the numbers in the table don't add up to 100 000.

04.3 Three-quarters of students correctly picked bar graph for representing the data given.

04.4 Very few students gained any credit for this question, many making reference to the data being an estimate, which was not creditworthy. Students did not really appear to understand the need to manipulate data to make it comparable.

There were many incorrect ideas:

- counting everyone would be too many or take too long
- smaller numbers make it easier for people to understand
- smaller numbers make collecting data easier and quicker
- because they do not know the exact number
- it is better to give a rough estimate
- makes data more accurate
- linking it to a graph, eg 'makes the data easier to plot', 'smaller numbers for plotting on a graph', 'number would be too high to plot on a graph'.

A very large proportion of students talked about unreported cases / 'not knowing they have it', giving what would have been a correct response for question 04.2.

04.5 68% of students gave two correct risks for increasing plaque in the coronary artery; 28% gained 1 mark.

04.6 About two-thirds of students correctly identified a stent as to the treatment for plaques in the coronary artery.

4.3.1.3 Bacterial diseases

Answer 05 · Examiner comments June 2024 | 8464/B/1F | Original Q4

04.7 The most common answer was able to articulate that there was a lack of blood flow, gaining 1 mark. However, students failed to link this to lack of oxygen or respiration.

Many students showed a misconception of the heart attack being caused by the heart having to beat faster to get blood past the blockage. Many descriptions/explanations were given as to what caused the blockage, which was not answering the question asked.

There were incorrect references to muscle cells moving in the blood rather than being part of the heart. A lot of answers saw students discussing the general role of arteries which were not specific to the question and they did not gain marks as the question asked about coronary arteries.

0 4 . 7 A heart attack can happen when plaques block a coronary artery.

During a heart attack muscle cells in the heart die.

Explain how the blockage can lead to the death of muscle cells in the heart.

[3 marks]

When the coronary artery fills with ~~plague~~ plaques, it decreases the flow of blood to the heart as it may clot. This leads to death of muscle cells as less blood is being transported to them, meaning the heart has less blood to pump around the body so the muscles contract less, which leads them to be weaker.

This response demonstrates the most common type of answer: the student has got to the idea of there being less blood flow to the heart muscle but does not link this to there being less oxygen, and therefore less respiration.
