AQA GCSE Combined Science - Trilogy | 8464

SPECIFICATION POINT 5.9.1.2

The Earth's early atmosphere

Mark schemes and examiner comments

Tier	**Foundation**
Question groups	**8**
Available paper years	**2018–2025**

Using this booklet

1. Booklet answer numbers match the question booklet.
2. Use the original question number within marking tables.
3. Examiner comments are included where available.

Name: _____ **Date:** _____

Where a precise marking extract is unavailable, the full source document is included in an appendix. Any missing mark scheme is explicitly identified.

5.9.1.2 The Earth's early atmosphere

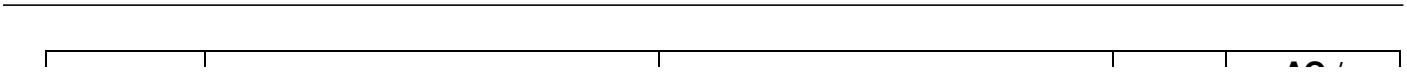

Answer 01 · Mark scheme June 2018 | 8464/C/2F | Original Q4

Question	Answers	Extra information	Mark	AO / Spec. Ref.

5.9.1.2 The Earth's early atmosphere

Answer 04 · Examiner comments November 2021 | 8464/C/2F | Original Q4

Question 4 (low and standard demand)

Very few students were able to explain why scientists were uncertain about the percentage of gases in the early atmosphere. The idea of there being a lack of evidence was rarely seen. 'No proof' alone was insufficient to gain credit. Students tended to focus their answers on the changes happening a long time ago, which did not gain credit as answers needed to indicate that they occurred billions of years ago. Students used the data in this question well.

Answer 05 · Examiner comments June 2022 | 8464/C/2F | Original Q1

Question 1

A straightforward introduction to the paper which mainly relied on interpreting supplied information.

01.1 Only about half of all students achieved this mark. Many students misinterpreted the scale on the *y*-axis and drew the line at 22% rather than 21%. There was no tolerance allowed on this graph for that reason. It is advised that students bring a ruler to their exams to use when drawing bar charts.

01.2 Many students knew that a burning splint is required to test for oxygen in this question.

01.3 Information taken from the pie charts was answered correctly by most students, with over half gaining 2 marks and 95% gaining at least 1 mark.

01.4 Another question testing knowledge of specification content that was not always well known with just over 60% of students gaining at least 1 mark.

01.5 Almost all students answered this correctly gaining 2 marks. The most common incorrect responses stated the concentrations at the peaks rather than the times.

Answer 05 · Examiner comments June 2022 | 8464/C/2F | Original Q1

01.6 The mark scheme required a link between increased use of transport at these times and the emissions of oxides of nitrogen, with approximately a third of students recognising this. Students should be encouraged to read the stem of each question.

5.9.1.2 The Earth's early atmosphere

Answer 06 · Examiner comments

June 2023 | 8464/C/2F | Original Q2

Question 2

02.1 Around a quarter of students gained both marks on this question. Half of all students gained one mark, most frequently for the idea that the oceans were formed from water. Far fewer were able to make the link between rock formation and carbon dioxide.

02.2 Nine in ten students were able to identify nitrogen as having the highest percentage.

02.3 One in five students gained all three marks here. A quarter completed the calculation correctly without then expressing it in standard form. Of the remaining students, very few were able to make progress, with one in twenty achieving one mark, usually for expressing an incorrect calculation in standard form. There were all combinations of calculations seen by examiners using the numbers 95 and 0.04.

02.4 This question proved to be the easiest on this year's examination, with over 97% achieving the correct answer.

02.5 Three quarters of students correctly calculated the mass of carbon dioxide. The most common incorrect response saw students multiply rather than divide the two numbers.

02.6 Around half of students correctly identified photosynthesis as the correct answer. The most common incorrect responses were respiration, distillation and deforestation.

02.7 Approximately one third of students gained two marks for this question, with one in ten gaining one mark. Many students did not identify the direction of change, suggesting Africa or South America changed the most, which was not creditworthy. Also, students often responded with ideas about developing areas and industrialised areas, without talking about the continents on the bar chart.

02.8 Students were able to calculate the percentage of landfill methane emissions from the pie chart with over 85% of students completing the question correctly.

02.9 Around half of students achieved both marks for interpreting the graphic. Only one in ten gained one mark. The most common response that gained no credit was for reuse and recycle the wrong way round. However, all of the other responses were commonly seen.

Answer 07 · Examiner comments

June 2024 | 8464/C/2F | Original Q1

Question 1 (low demand)

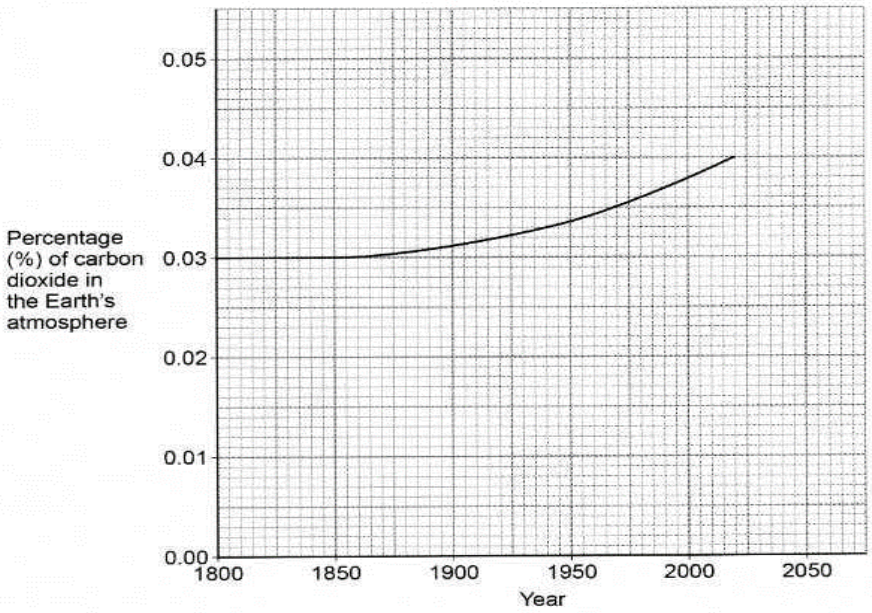

01.1 This AO1 question proved a challenging start to the paper, with just over a quarter of students gaining both marks and more than half of students not gaining any marks. Many students gave the percentage of oxygen in the air as 80%.

01.2 Two-thirds of students could identify at least one of the reasons why the percentage of carbon dioxide decreased in the Earth's early atmosphere, with photosynthesis being the most common correct answer. Deforestation and respiration were the most common incorrect responses.

01.3 About 40% of students were able to gain 1 mark on this AO2 question, often for recognising that the trend was increasing. Mention of the constant level from 1800 was less often seen, although about a third of students were able to gain all 3 marks. Some students not only described the trend but suggested reasons for it, which was not necessary for this 'describe' question; students would benefit from a clear understanding of the expectations of the command word.

0 1 . 3 **Figure 1** shows the change in the percentage of carbon dioxide in the Earth's atmosphere from 1800 to 2020.

Figure 1

Describe the trend in the percentage of carbon dioxide in the Earth's atmosphere from 1800 to 2020.

Use data from **Figure 1**.

[3 marks]

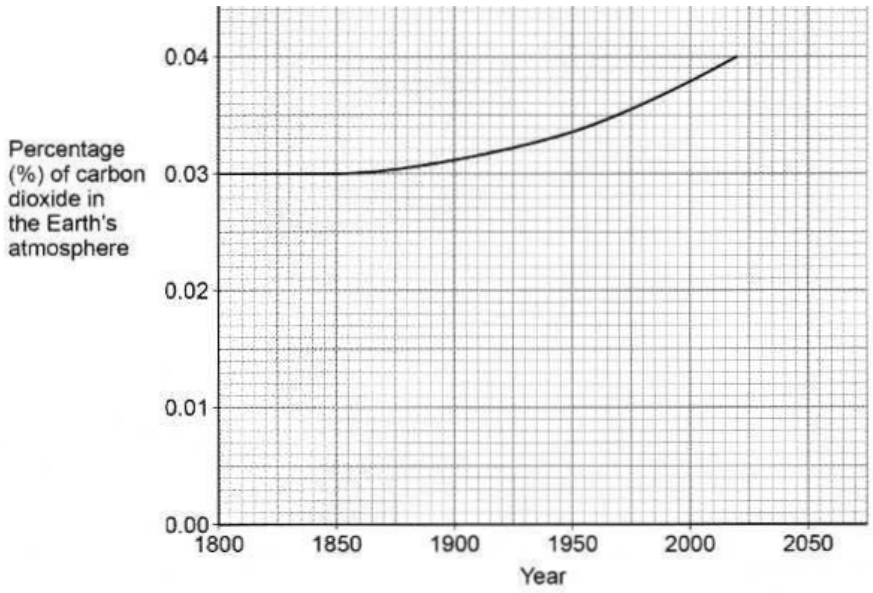

as the years go on, the percentage of carbon dioxide in the Earth's atmosphere increases slowly. from 0.03 in 1800 to 0.04 in 2020.

This is a typical response that only gained 1 of the 3 marks: the student has identified the upwards trend but has not described the constant levels nor the date at which the change happens.

© 2024 AQA and its licensors. All rights reserved.

5.9.1.2 The Earth's early atmosphere

Answer 07 · Examiner comments June 2024 | 8464/C/2F | Original Q1

Describe the trend in the percentage of carbon dioxide in the Earth's atmosphere from 1800 to 2020.

Use data from **Figure 1**.

[3 marks]

from 1800 to 1850 the percentage of carbon dioxide in the earths atmosphere stayed the same however from 1850 - 2000 the percentage of carbon dioxide increased in the earths atmosphere

This student has gained all 3 marks, by identifying that the percentage was constant, then increased and giving the date (1850) where the change was observed.

01.4 Methane was well known as a greenhouse gas.

01.5 The link between climate change and greenhouse gases was also well known.

01.6 The method of calculating a relative formula mass as not well known, with fewer than a third of students correctly performing this calculation. Common mistakes were to add the two A_r values, multiply them together or subtract one from another.

© 2024 AQA and its licensors. All rights reserved.

5.9.1.2 The Earth's early atmosphere

Answer 07 · Examiner comments June 2024 | 8464/C/2F | Original Q1

0 1 . 6 Calculate the relative formula mass (M_r) of carbon dioxide (CO_2).

Relative atomic masses (A_r): C = 12 O = 16

[2 marks]

16-12

Relative formula mass of carbon dioxide = 4

0 1 . 6 Calculate the relative formula mass (M_r) of carbon dioxide (CO_2).

Relative atomic masses (A_r): C = 12 O = 16

[2 marks]

12 x 16 = 192

C x O = 192

Relative formula mass of carbon dioxide = 192

0 1 . 6 Calculate the relative formula mass (M_r) of carbon dioxide (CO_2).

Relative atomic masses (A_r): C = 12 O = 16

[2 marks]

16 + 12 = 28

Relative formula mass of carbon dioxide = ~~4~~ 28

These examples demonstrate common errors shown by students in answering this question.

In the first response, the student has subtracted one A_r value from another; in the second the student has multiplied the two A_r values together; in the third the student has added the two A_r values together.

None of these responses gained any marks.

5.9.1.2 The Earth's early atmosphere

Answer 08 · Examiner comments

June 2025 | 8464/C/2F | Original Q6

Question 6 (Standard demand)

06.1 The test for oxygen was not well known, there were a lot of blank scripts. Those who did attempt the question often referred to lit or burning splints, or sometimes both glowing and lit together. Also, a significant number of students referred to smouldering splints, or splints that had been previously lit as opposed to a glowing splint. This standard test needs to reference 'glowing'. A splint that has been previously lit and then blown out is not equivalent.
The most common incorrect response was students attempting to describe the test for hydrogen, with students referencing the squeaky pop test.

06.2 This was an 'extended response' style of question. Such questions are marked holistically. There are overall generic descriptions for the three levels of response at the top of the mark scheme, giving a hierarchy of response. Within each level there are 2 marks.

Simply quoting the data from the table was not creditworthy. Students who did not use comparative language, such as higher, lower, only or just, to compare percentages failed to gain credit. Quoted figures needed to be correct.

Simple comparative statements limited the student to Level 1.

To access Level 2, the student had to offer at least two comparisons of percentage composition along with some correctly linked explanations, although all three gases did not have to be addressed.

To access Level 3 students had to correctly identify the change in percentage composition for all three gases from the early atmosphere to the current day and explain at least two of them.

Many students simply copied out the given information and therefore failed to gain any marks. The majority of the responses were in Level 1, as students failed to explain how the changes that they had described, came about. Where they did, contradictions were made, and the credit was disqualified. Where credit was given, it was mainly as a result of a description of plants photosynthesising.

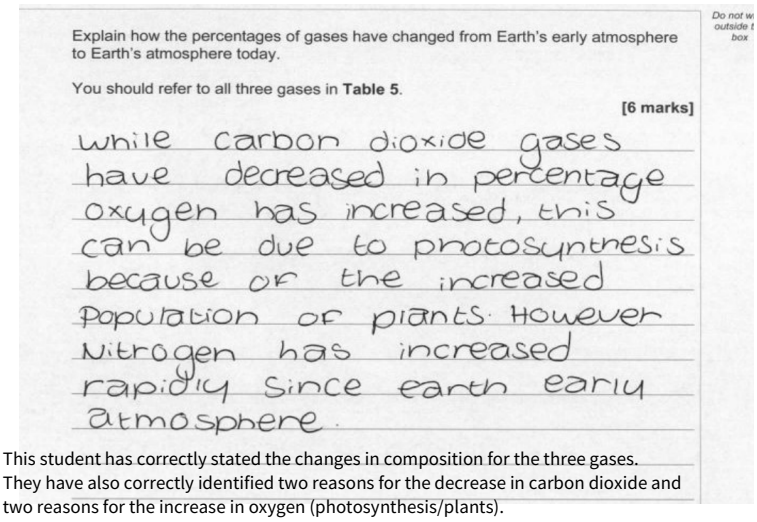

A significant number of students attempted to explain the changes in terms of climate change and the burning of fossil fuels, increased transport and pollution.

5.9.1.2 The Earth's early atmosphere

Answer 08 · Examiner comments

June 2025 | 8464/C/2F | Original Q6

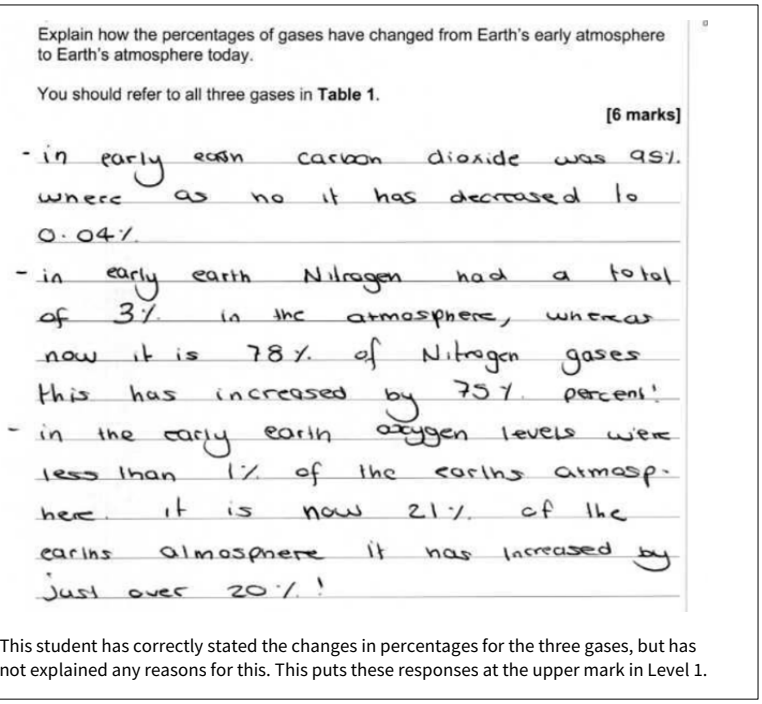

Explain how the percentages of gases have changed from Earth's early atmosphere to Earth's atmosphere today.

You should refer to all three gases in **Table 5**.

[6 marks]

while carbon dioxide gases have decreased in percentage oxygen has increased, this can be due to photosynthesis because of the increased population of plants. However Nitrogen has increased rapidly since earth early atmosphere.

This student has correctly stated the changes in composition for the three gases.
They have also correctly identified two reasons for the decrease in carbon dioxide and two reasons for the increase in oxygen (photosynthesis/plants).
This achieves the lower mark in Level 3.

Explain how the percentages of gases have changed from Earth's early atmosphere to Earth's atmosphere today.

You should refer to all three gases in **Table 1**.

[6 marks]

- in early earth carbon dioxide was 95% where as no it has decreased to 0.04%.
- in early earth Nitrogen had a total of 3% in the atmosphere, whereas now it is 78% of Nitrogen gases this has increased by 75% percent!
- in the early earth oxygen levels were less than 1% of the earths atmosphere. it is now 21% of the earths atmosphere it has increased by just over 20%!

This student has correctly stated the changes in percentages for the three gases, but has not explained any reasons for this. This puts these responses at the upper mark in Level 1.

© 2024 AQA and its licensors. All rights reserved.

5.9.1.2 The Earth's early atmosphere

Answer 08 · Examiner comments June 2025 | 8464/C/2F | Original Q6

06.3 Many students appreciated that cattle farming leads to methane emissions but did not always refer to a reduction in this type of farming being required. There were many responses that answered as an absolute rather than a comparison which was insufficient for the mark. The question was looking for the idea that 'less' farming of livestock or 'less' use of fossil fuels would reduce methane for example, not stopping farming or stopping the use of fossil fuels altogether.

As they were told that methane is a greenhouse gas, some students confused the reduction of methane emissions with that of carbon dioxide and made suggestions such as planting more trees or burying methane underground.

06.4 How sulfur dioxide is released into the atmosphere was not well known, resulting in many blank scripts.
The most common insufficient response for marking point 1 was that 'fuels', rather than 'fossil fuels', were being burnt. Many students referred to the use of cars but did not link this to the burning of fossil fuels.
Students trying to explain the formation of sulfur dioxide often referred to the sulfur reacting with carbon dioxide rather than with oxygen. Very few students gained 2 marks.

06.5 Less than 20% of students could recall any problem associated with sulfur dioxide. There were many vague answers such as its toxic, causing difficulty in breathing, causing cancer, climate change, global warming, harms the environment and burns the skin. None of which gained any credit.
Acid rain was rarely mentioned and the correct terminology of 'respiratory' problems even less so.

0 6 . 5 Give **one** harmful effect of sulfur dioxide emissions. **[1 mark]**

Struggle to breathe properly.

The student has tried to offer a creditworthy response but has used incorrect terminology.
The question is looking for 'respiratory issues/problems' as opposed to breathing.
This is a higher demand question and correct terminology is required.

06.6 Students found this question difficult.
A common misconception appeared to be that sulfur itself is used as a fuel and we now do not use it as much.
Some students did attempt to link the reduction in sulfur dioxide to the use of electric vehicles. The common error here however was that they had to clearly imply 'increased' use of electric vehicles, and most did not.
